## MATH 7

## HOMEWORK 28 VECTORS

APRIL 28, 2019

## Vectors

A vector is a directed segment. We denote the vector from $A$ to $B$ by $\overrightarrow{A B}$. We will also frequently use lower-case letters for vectors: $\vec{v}$.

We will consider two vectors to be the same if they have the same length and direction; this happens exactly when these two vectors form two opposite sides of a parallelogram. Using this, we can write any vector $\vec{v}$ as a vector with tail at given point $A$. We will sometimes write $A+\vec{v}$ for the head of such a vector.

Vectors are used in many places. For example, many physical quantities(velocities, forces, etc) are naturally described by vectors.

## VECTORS IN COORDINATES

Recall that every point in the plane can be described by a pair of numbers - its coordinates. Similarly, any vector can be described by two numbers, its $x$-coordinate and $y$-coordinate: for a vector $\overrightarrow{A B}$, with tail $A=\left(x_{1}, y_{1}\right)$ and head $B=\left(x_{2}, y_{2}\right)$, its coordinates are

$$
\overrightarrow{A B}=\left(x_{2}-x_{1}, y_{2}-y_{1}\right)
$$

$$
\overrightarrow{A B}=(8-5,4-3)=(3,1)
$$

Operations with vectors
Let $\vec{v}, \vec{w}$ be two vectors. Then we define a new vector, $\vec{v}+\vec{w}$ as follows: choose $A, B, C$ so that $\vec{v}=\overrightarrow{A B}$, $\vec{w}=\overrightarrow{B C}$; then define

$$
\vec{v}+\vec{w}=\overrightarrow{A B}+\overrightarrow{B C}=\overrightarrow{A C}
$$

In coordinates, it looks very simple: if $\vec{v}=\left(v_{x}, v_{y}\right)$, $\vec{w}=\left(w_{x}, w_{y}\right)$, then

$$
\vec{v}+\vec{w}=\left(v_{x}+w_{x}, v_{y}+w_{y}\right)
$$

Theorem. So defined addition is commutative and associative:

$$
\begin{aligned}
\vec{v}+\vec{w} & =\vec{w}+\vec{v} \\
\left(\overrightarrow{v_{1}}+\overrightarrow{v_{2}}\right)+\overrightarrow{v_{3}} & =\overrightarrow{v_{1}}+\left(\overrightarrow{v_{2}}+\overrightarrow{v_{3}}\right)
\end{aligned}
$$

There is no obvious way of multiplying two vectors; however, one can multiply a vector by a number: if $\vec{v}=\left(v_{x}, v_{y}\right)$ and $t$ is a real number, then we define

$$
t \vec{v}=\left(t v_{x}, t v_{y}\right)
$$

## Problems

1. (a) Let $A=(3,6), B=(5,2)$. Find the coordinates of the vector $\vec{v}=\overrightarrow{A B}$ and coordinates of the points $A+2 \vec{v} ; A+\frac{1}{2} \vec{v} ; A-\vec{v}$.
(b) Repeat part (a) for points $A=\left(x_{1}, y_{1}\right), B=\left(x_{2}, y_{2}\right)$
2. Let $A=\left(x_{1}, y_{1}\right), B=\left(x_{2}, y_{2}\right)$. Show that the midpoint $M$ of segment $A B$ has coordinates $\left(\frac{x_{1}+x_{2}}{2}, \frac{y_{1}+y_{2}}{2}\right)$ and that $\overrightarrow{O M}=\frac{1}{2}(\overrightarrow{O A}+\overrightarrow{O B})$.
[Hint: point $M$ is $A+\frac{1}{2} \vec{v}$, where $\vec{v}=\overrightarrow{A B}$ ].
3. Consider a parallelogram $A B C D$ with vertices $A(0,0), B(3,6), D(5,-2)$. Find the coordinates of:
(a) vertex $C$
(b) midpoint of segment $B D$
(c) midpoint of segment $A C$
4. Repeat the previous problem if coordinates of $B$ are $\left(x_{1}, y_{1}\right)$, and coordinates of $D$ are $\left(x_{2}, y_{2}\right)$. Use the result to prove that diagonals of a parallelogram bisect each other (i.e., the intersection point is the midpoint of each of them).

## 1. Review Problems

5. Review Homeworks 5-8.
6. Given the sequence $11,18,25, \ldots$, what is the common difference? What is the 10 th term? What is the sum of the first 100 terms?
7. What is $5+7+9+\ldots+25$ ?
8. What is the common difference of an arithmetic sequence if the $3 r d$ term is 18 and the $11 t h$ term is 44?
9. What is $\frac{1}{3}+\frac{1}{3^{2}}+\frac{1}{3^{3}}+\ldots+\frac{1}{3^{10}}$ ?
10. What is $\frac{1}{3}+\frac{1}{3^{2}}+\frac{1}{3^{3}}+\ldots$ ?
11. What is $\binom{5}{3}$ ? What is in general $\binom{n}{k}$ ?
12. Draw Pascal's triangle.
13. How many distinct 7 -unit paths are there from the lower left to the upper right corner?

14. Compute $\sqrt{2+\sqrt{2+\sqrt{2+\ldots}}}$
15. Compute $\frac{1}{2+\frac{1}{2+\frac{1}{2+\ldots}}}$
