Math 7: Handout 4 Algebraic Identities: Summary. Pythagoras' Theorem.

Main Algebraic Identities.

Here is a list of the main algebraic identities we discussed:

- 1. $(ab)^n = a^n b^n$ 2. $\sqrt{ab} = \sqrt{a}\sqrt{b}$ 4. $(a-b)^2 = a^2 - 2ab + b^2$ 5. $a^2 - b^2 = (a-b)(a+b)$
- 3. $(a+b)^2 = a^2 + 2ab + b^2$

Replacing in the last equality *a* by \sqrt{a} , *b* by \sqrt{b} , we get

$$(\sqrt{a} - \sqrt{b})(\sqrt{a} + \sqrt{b}) = a - b$$

which is very helpful in simplifying expressions with roots, for example:

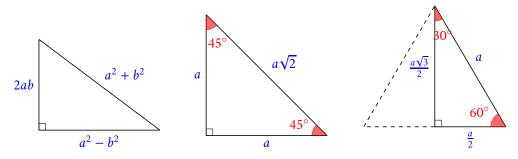

$$\frac{1}{\sqrt{2}+1} = \frac{1}{\sqrt{2}+1} \times \frac{\sqrt{2}-1}{\sqrt{2}-1} = \frac{\sqrt{2}-1}{2-1} = \sqrt{2}-1$$

We also discussed solving simple equations: linear equation (i.e., equation of the form ax + b = 0, with *a*, *b* some numbers, and *x* the unknown) and equation where the left hand side is factored as product of linear factors, such as (x - 2)(x + 3) = 0.

Pythagoras' Theorem

In a right triangle with legs *a* and *b*, and hypotenuse *c*, the square of the hypotenuse is the sum of squares of each leg. $c^2 = a^2 + b^2$. The converse is also true, if the three sides of a triangle satisfy $a^2 + b^2 = c^2$, then the triangle is a right triangle. Some Pythagorean triples are: (3,4,5), (5,12,13), (7,24,25), (8.15,17), (9,40,41), (11,60,61), (20,21,29).

To generate such Pythagorean triples, choose two positive integers a and b. Then plug the values into the sides as shown on the first picture:

Try to figure out why the sides of this triangle satisfy the Pythagoras' Theorem!

45-45-90 Triangle: If one of the anglesin a right triangle is 45°, the other angle is also 45°, and two of its legs are equal. If the length of a leg is *a*, the hypothenuse is $a\sqrt{2}$.

30-60-90 Triangle: If one of the angles in a right triangle is 30°, the other angle is 60°. Such triangle is a half of the equilateral triangle. That means that if the hypothenuse is equal to *a*, its smaller leg is equal to the half of the hypothenuse, i.e. $\frac{a}{2}$. Then we can find the other leg from the Pythagoras' Theorem, and it will be equal to $\frac{a\sqrt{3}}{2}$.

Homework

1. Simplify

a.
$$\frac{42^2}{6^2} =$$

b. $\frac{6^3 \times 6^4}{2^3 \times 3^4} =$
c. $(2^{-3} \times 2^7)^2 =$
d. $\frac{3^2 \times 6^{-3}}{10^{-3} \times 5^2} =$

2. Simplify

a.
$$\frac{a}{2} + \frac{b}{4} =$$

b. $\frac{1}{a} + \frac{1}{b} =$
c. $\frac{3}{x} + \frac{5}{xy} + \frac{5}{3a} =$

- 3. Using algebraic identities calculate
 - a. $299^2 + 598 + 1 =$
 - b. $199^2 =$
 - c. $51^2 102 + 1 =$
- 4. Expand
 - a. $(4a b)^2 =$ b. (a + 9)(a - 9) =
 - c. $(3a 2b)^2 =$
- 5. Factor
 - a. ab + ac =
 - b. 3a(a+1) + 2(a+1) =
 - c. $36a^2 49 =$
- 6. Write each of the following expressions in the form $a + b\sqrt{3}$, with rational *a*, *b*:

a.
$$(1 + \sqrt{3})^2$$

b. $(1 + \sqrt{3})^3$
c. $\frac{1}{1 - 2\sqrt{3}}$
d. $\frac{1 + \sqrt{3}}{1 - \sqrt{3}}$
e. $\frac{1 + 2\sqrt{3}}{\sqrt{3}}$

- 7. In a trapezoid ABCD with bases AD and BC, $\angle A = 90^{\circ}$, and $\angle D = 45^{\circ}$. It is also known that AB = 10 cm, and AD = 3BC. Find the area of the trapezoid.
- 8. In a right triangle ABC, BC is the hypotenuse. Draw AD perpendicular to BC, where D is on BC. The length of BC=13, and AB=5. What is the length of AD?
