

- **1 Mole [mol]** of any substance contains the same number of molecules, called **Avogadro Number**:

$$N_A \approx 6.02 \cdot 10^{23} \frac{1}{mol}$$

- **Molar Mass, μ [g/mol]** is the mass of 1 mole of a given substance. To find it, you need to add up **atomic weights** of all the atoms in a single molecule. Those can be found in Periodic Table.

Example:

$$\mu_{H_2O} = (2 + 16) \frac{g}{mol} = 18 \frac{g}{mol}$$

	Volume	Mass	Amount of Substance	Number of Molecules
Symbol	V	M	n	N
Units	[m ³] or [cm ³]	[kg] or [g]	[mol]	1

$$\rho = \frac{M}{V}$$

Greek 'rho'

$$n = \frac{M}{\mu}$$

Greek 'mu'

$$V = \frac{N}{N_A}$$

Ideal Gas Law

$$PV = nRT$$

Here $n = \frac{m}{\mu}$ is amount of substance (in moles),
 $R \approx 8.3 \frac{J}{mol \cdot K}$ is called Universal Gas Constant.

Boyle's Law:

$PV = \text{const}$ when $T = \text{const}$

Charles's Law:

$V/T = \text{const}$ when $P = \text{const}$

Gay-Lussac's Law:

$P/T = \text{const}$ when $V = \text{const}$

P-V diagram

Homework

Problem 1 An air bubble in water had volume $V = 10$ ml at depth $h = 20$ m. Find its volume right before the bubble reaches the surface. Assume the temperature of the air inside to be constant (typically, not true!).

Problem 2 Density of a gas is ρ_0 at temperature T_0 (in Kelvin). Find the density at temperature T , and the same pressure.

Problem 3 Suppose you know density ρ (in g/ml) and molar mass μ (in g/mol) for certain substance. Find how many molecules are contained in volume V of this substance (you need to derive a general formula). Using this formula, determine how many molecules are there in $V = 100$ ml of each of the materials in the table (you will need to consult the Periodic table to find μ):

Substance	ρ (g/ml)	μ (g/mol)	# of molecules in $V = 100$ ml
liquid water, H_2O	1		
liquid propane, C_3H_8	0.5		
Calcite (chalk)	2.7		
Aluminum*, Al	2.7		
Gold*, Au	19.3
