Distance, Time, Speed

d – **distance** travelled

v – average speed

$$v = \frac{d}{\Delta t}$$

 $\Delta t = t_{final} - t_{initial}$ — travel **time** Δ (Delta) stands for "change"

Physical Quantity	Standard Units (metric system)	Other Units
Length, distance (d)	meter (m)	kilometer: 1km = 1000m centimeter: 1cm = 0.01 m 1 mile ≈ 1.6 km; 1ft ≈ 0.3 m; 1inch ≈ 2.5 cm
Time (t)	second (s)	hour: 1hr = 3600 s
Speed (s)	m/s	km/hr, mile/hr (mph) cm/s, km/s

Homework 2

Problem 1. Below is the schedule of "Acela" train that runs from Washington DC to New York City:

Washington (0 mi) 5:00 am
Baltimore (41 mi) 5:30 am
Philadelphia (135 mi) 6:30 am
New York (226 mi) 7:42 am

Find the average speed (in miles per hour, mph) for each of the three segments, and for the whole trip. Convert your results first to km/hr, and then to meters per second (m/s):

Segment	Speed (mph)	Speed (km/hr)	Speed (m/s)
Washington-Baltimore			
Baltimore-Philadelphia			
Philadelphia-NYC			
Washington-NYC			

Problem 2. Measure speed of a moving object (toy, rain drop on a window, a pet...). Sketch your experiment, record your data and compute the result (both in the units in which you made your measurements, and in m/s).
