

# Processes at the Ocean Surface:

1. Water heating by the Sun, ↑ **temperature**
2. Water evaporation (salt is left behind), ↑ **salinity**
3. Precipitation (fresh water input), ↓ **salinity**
4. Water cooling (cold winds/ice masses), ↓ **temperature**
5. Ice melt (fresh water is released), ↓ **salinity**
6. Ice formation (salt is left behind), ↑ **salinity**
7. Large river inflow (fresh water input), ↓ **salinity**
8. Water movement (pushed by winds/tides)

# Processes in the Deep:

9. Water rise and fall (density difference)
10. Deep water downhill flow at the ocean bottom

Interplay of these processes defines **ocean circulation**.

# Ocean Circulation

Water in the ocean is in constant motion.

- An **ocean current** is the movement of seawater in a certain direction (like a river in the ocean):
  - surface currents
  - deep currents
  - vertical currents
- Ocean **circulation** is the **combined effect of all currents** that move in oceans.

Visualization of global ocean  
*surface* currents 2005-2007

# Surface Currents

- Wind driven (caused by friction between water and moving air).
- Horizontal currents, occur at the surface.
- Push the **top 400 m layer of water**.
- Form large circular patterns called gyres due to *Coriolis effect* (clockwise in Northern Hemisphere counterclockwise in Southern Hemisphere)

# Gulf Stream

The **Gulf Stream** is a **strong**, **fast** moving, **warm** ocean current that originates in the Gulf of Mexico and flows into the Atlantic Ocean at a speed of about 1-5 mph. It transports nearly **4 billion cubic feet of water per second**, an amount greater than that carried by all of the world's rivers combined.

The Gulf Stream, Winslow Homer, 1899

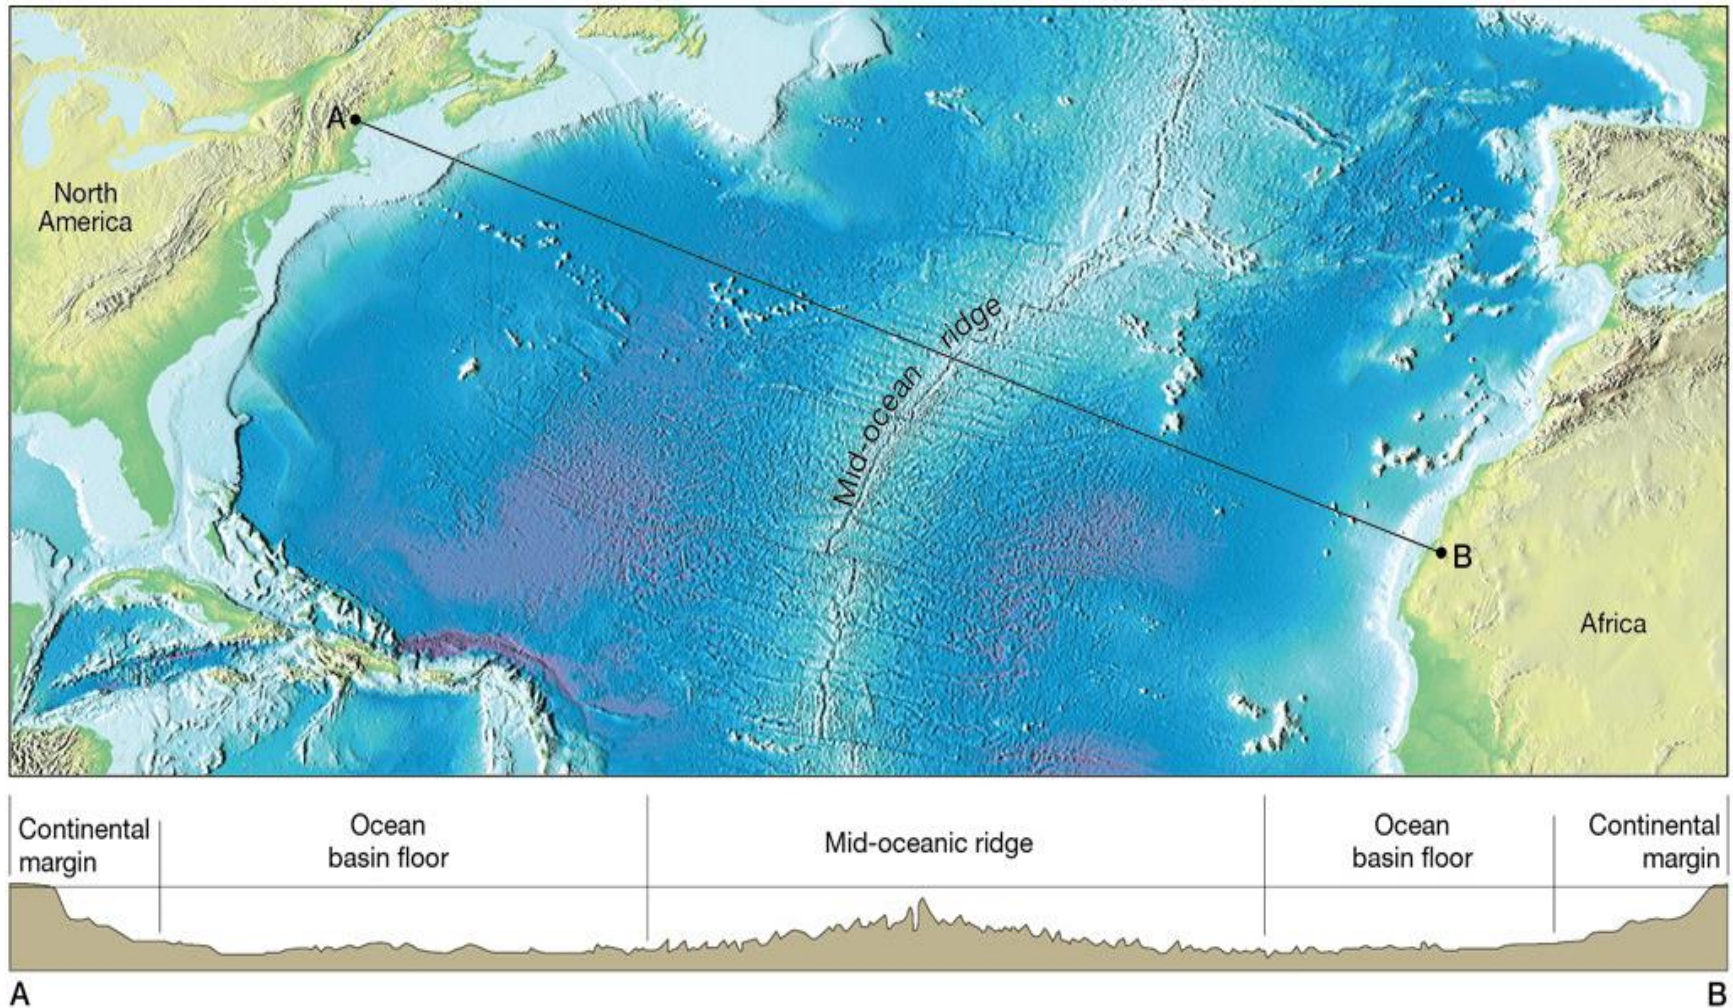

- First discovered in **1513** by the Spanish explorer **Juan Ponce de Leon** and was then used extensively by Spanish ships as they travelled from the Caribbean to Spain.

- In **1786**, **Benjamin Franklin** mapped the current, further increasing its usage.

100 km wide  
800 to 1,200 m deep

# North Atlantic Ocean Basin Profile

The ocean floor is not flat.  
It has well-pronounced valleys that guide the *deep currents*.

# Deep Currents

**Deep currents** are directed by ocean bottom relief: water masses move “down the hill”.

- Originate from polar regions.
- **Cold** and **saline**.
- More *massive* and *move slower* than surface currents.
- Form from warm and saline surface water masses that cool down ( $\uparrow$  **density**) and sink due to increased density.

**Example:**

**North Atlantic Deep Water**

# Vertical Circulation: Thermohaline

Water masses can rise and fall because of **density differences** due to variation of **temperature** and **salinity** with depth.

- $\uparrow$ salinity =  $\uparrow$ density, therefore water masses sink
- $\uparrow$ temperature =  $\downarrow$ density therefore water masses float

# Wind Driven Upwelling/Downwelling

- Wind blows, pushes water away (note that water is deflected due to Coriolis effect), causes deep cold water to rise up to replace it.
- Vertical currents: equatorial and coastal.
- Upwelling brings nutrients to surface: sites of rich fisheries.

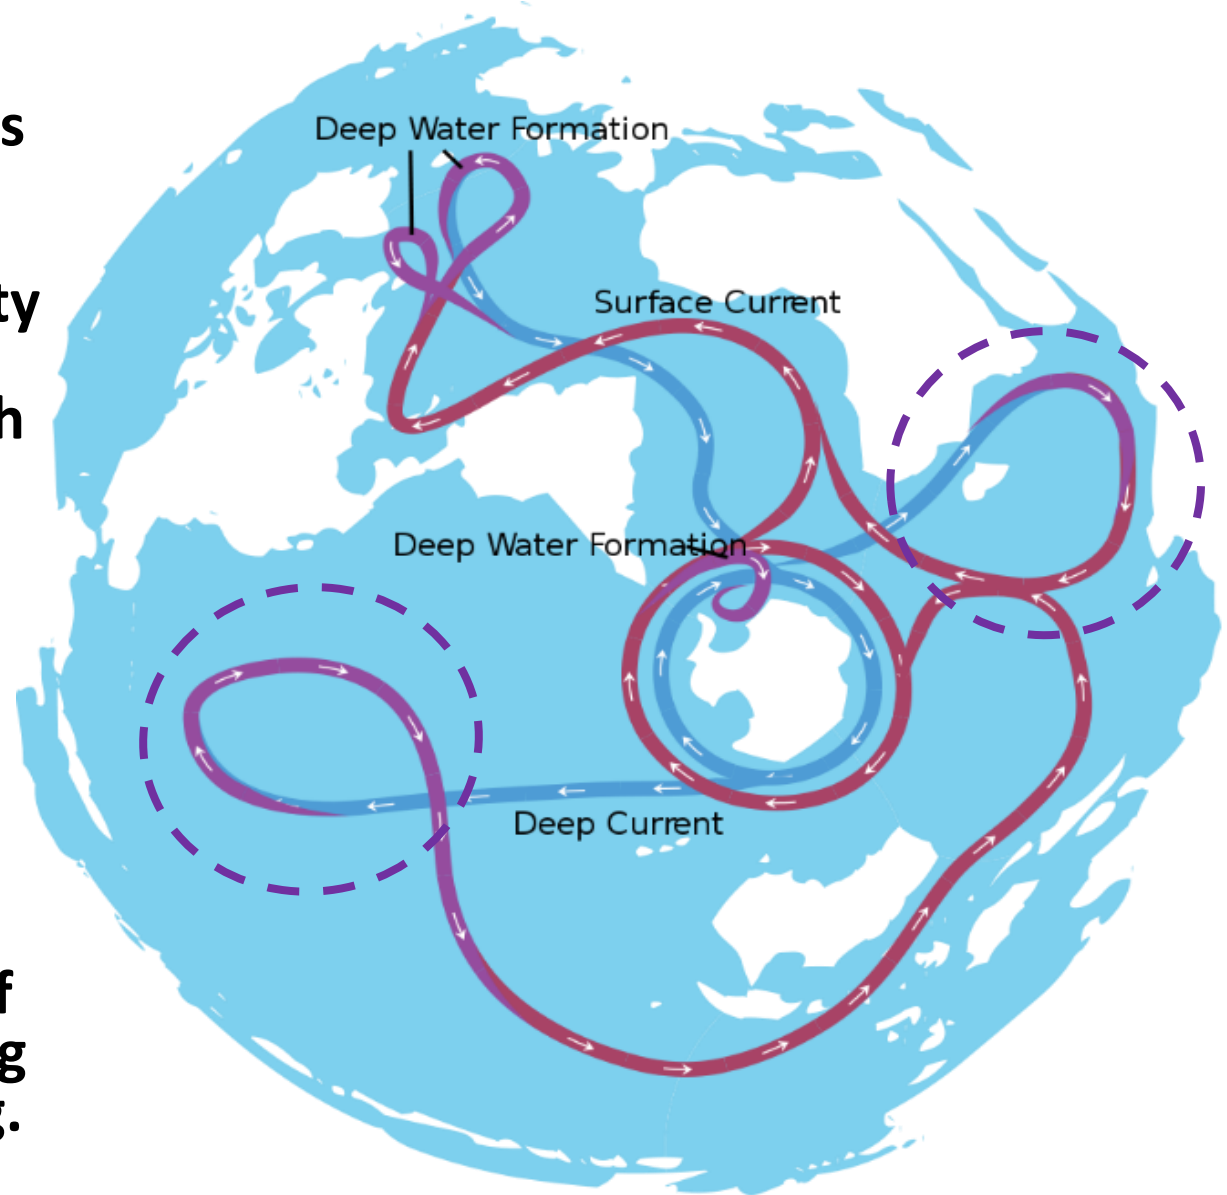

## Coastal (Ex: West Coast, Southern Hemisphere)

# Overturning Circulation

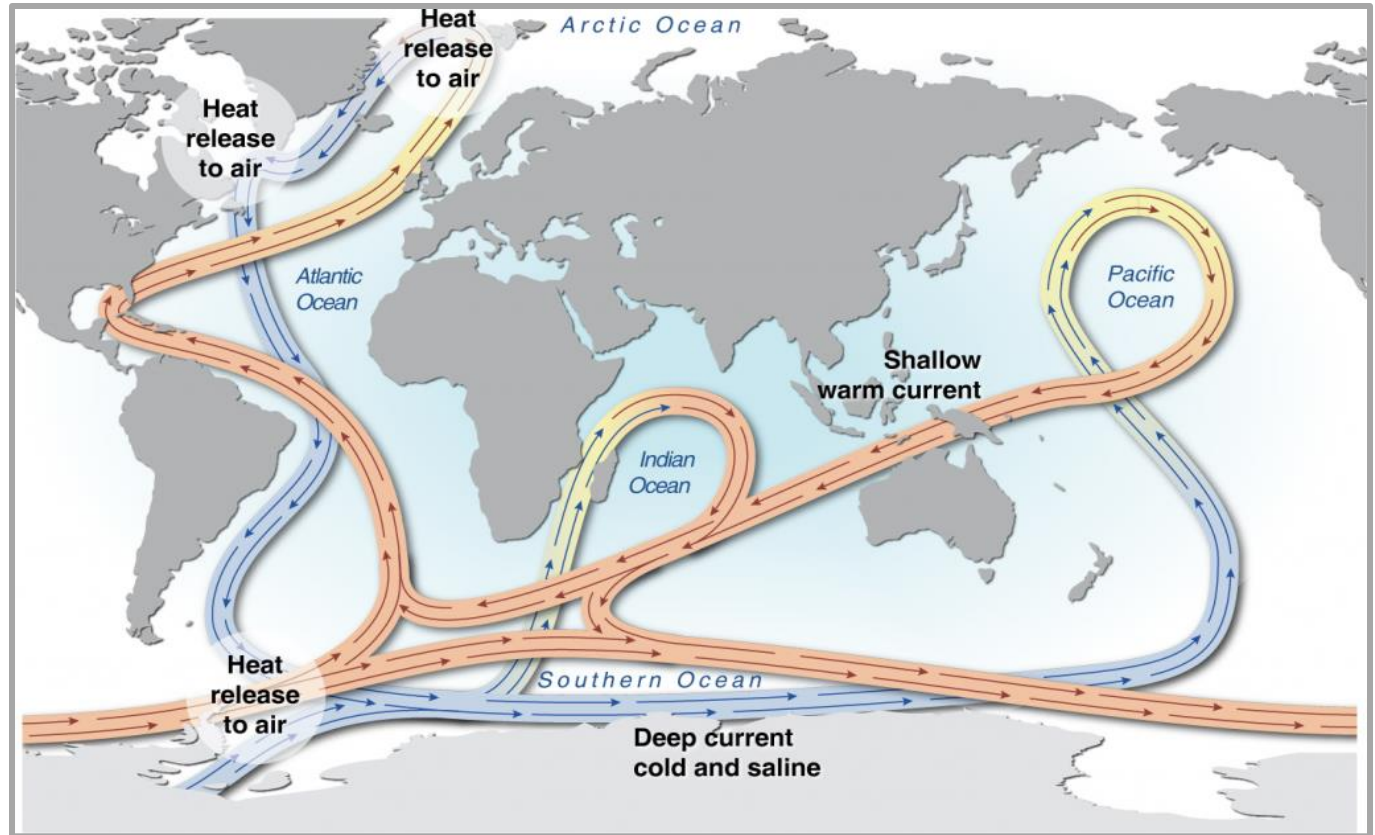

- **Deep water** forms in polar regions: in Antarctic when the extremely frigid salty surface water sinks rapidly, and in North Atlantic due to evaporative cooling in Nordic seas.
- Upward flow **overturning** occurs in the Pacific and Indian Oceans mainly as a result of equatorial upwelling followed by heating.

# Conveyor Belt Circulation

*Vertical* currents combined with *surface and deep* currents result in global **conveyor belt** movement of water.

It takes **several hundred years** for the conveyor belt to turn over the ocean's waters and make **one complete trip around the Earth**.

The ocean plays a major role in the distribution of the Earth's heat through deep sea circulation.

# Conveyer Belt 3D

Antarctic Bottom Water - the densest and coldest water in the free ocean.

**SLW** Surface Layer Water  
**SAMW** Subantarctic Mode Water  
**RSW** Red Sea Water  
**AABW** Antarctic Bottom Water  
**NPDW** North Pacific Deep Water  
**ACCS** Antarctic Circumpolar Current System  
**CDW** Circumpolar Deep Water

**NADW** North Atlantic Deep Water  
**UPIW** Upper Intermediate Water,  $26.8 \leq \sigma_{\theta} \leq 27.2$   
**LOIW** Lower Intermediate Water,  $27.2 \leq \sigma_{\theta} \leq 27.5$   
**IODW** Indian Ocean Deep Water  
**BIW** Banda Intermediate Water  
**NIW** Northwest Indian Intermediate Water
