## WARM-UP

1
Mental math. Find a value of each expression.
$20+30+10=$
$90-50-30=$
$80-60+20=$
$70-10+20=$
$50+10-40=$
$60+30-90=$

2 State which equality below is TRUE (mark with T) and which one is FALSE (mark with F):
$2+5=6$ $\qquad$ $12=10+2$ $\qquad$
$3+5=2+5$ $\qquad$ $3+2=2+3$ $\qquad$
$4+4=8$ $\qquad$ $32=23$ $\qquad$
$3+4+2=4+5$ $\qquad$ $5+3=8+1$ $\qquad$

3 Find the difference between two numbers:
a) 36 and 16 $\qquad$
b) 27 and 27 $\qquad$
c) 67 and 36 $\qquad$

## Homework Review

1. Two small boxes have the same amount of balls. One big box has as many balls as the other two together. Write an equation to show how many balls are in the big box.

L balls
L balls
2. Without lifting up you pencil connect 9 points with 4 straight line segments.

4 Look at the definitions below and connect each definition with a correct term.

- is a straight.

Ray

- goes in both directions.
- does not end ... so you can't measure its length
- is straight.
- is part of a line.
- has one endpoint.
- goes in ONE direction.
- is straight.

## Line Segment

- is a part of a line.
- has 2 endpoints that show the points that end the line.

## Intersection of Lines.

Two different lines in the same plane will either intersect or not. If the lines intersect, they share a common point, which is called the point of intersection.

If lines do NOT intersect, they are called Parallel lines. Parallel lines never intersect. In the real world a good example of parallel lines is a railroad.

Give the examples of intersecting lines in real life.
a) This line is called $\overleftrightarrow{A B}$. It can also be called $\overleftrightarrow{B A}$. Line $\overleftrightarrow{B A}$ is the same as line $\overleftrightarrow{A B}$. Arrows show that a line should be continued indefinitely.

b) This is a ray $\overrightarrow{A B}$. A ray is a part of a line, which starts at a point and goes off in a particular direction to infinity. Is ray $\overrightarrow{A B}$ the same as ray $\overrightarrow{B A}$ ?

c) Does a line have length? What about a ray? Can you give an example of a geometric object, which has a length?

Using your ruler draw:
a) Two line segments, which intersect at point K .
b) Two line segments, which do NOT intersect and are not parallel.
c) Two line segments, which are parallel.

7 Consider a pair of rays $\overrightarrow{A B}$ and $\overrightarrow{C D}$. Using your ruler draw:
a) Two rays which intersect at point M
b) Two rays which do NOT intersect and are not parallel)
c) Two rays which are parallel
a) Using a ruler, extend lines $\boldsymbol{a}$ and $\boldsymbol{b}$. Find their intersection points with other lines and label those points by any capital letters you choose. Which lines are parallel to each other?

## REVIEW

## 100 ones $=10$ tens $=1$ hundred

2 hundred and 8 tens $=280$
3 hundred, 5 tens and 2 ones $=$ $\qquad$
7 hundred, 0 tens and 8 ones $=$ $\qquad$
5 hundred, 9 tens and 0 ones $=$ $\qquad$

## Adding two-digit or three-digit numbers:

Place one number under the other number so that the tens' place digits and ones' place digits are lined up.
Draw a line under the bottom number.
Add the ones' place digits ( $\mathbf{3}+\mathbf{5}=\mathbf{8}$ ).
43
$+\underline{55}$
8
Add the numbers in the tens' place column $(\mathbf{4}+\mathbf{5}=\mathbf{9})$ and place the answer below the line and to the left of the ones' place sum.

43
$+\underline{55}$
98
When you add three-digit numbers, write the numbers one under another - in the column form, lined up ones under ones, tens under tens and hundreds under hundreds. Start the addition from ones, then add tens (don't forget about regrouping - carrying lover the next higher place value, if the sum of 2 digits is greater that 9)

## Calculate:

11 Calculate:
$44+710=$ $\qquad$
$117+72=$ $\qquad$
$111+513=$ $\qquad$
$678+301=$ $\qquad$

12 Fill in the missing digits:

Solve the problems:
a) Tom had 8 marbles. Then Jerry gave him some more marbles. Now Tom has 17 marbles. How many marbles did Jerry give him?

Given (what we know): $\qquad$

Question (what we should find): $\qquad$
Solution: $\qquad$

Answer:_Jerry gave Walter $\qquad$ marbles.
b) There are twelve girls in a class of 25 students. How many boys are in the class?

Given (what we know): $\qquad$

Question (what we should find): $\qquad$
Solution: $\qquad$

Answer: $\qquad$
$\qquad$ boys in the class.
