## Math 2 Classwork 18

## Warm Up

Write a numerical expression for each line and find the value:
a) 45 is 29 more than what number?
b) What is the result of adding 8 twos together? $\qquad$
c) What is the result of multiplying 4 threes? $\qquad$
2 Fill in the missed numbers:
$6 \times 8=(\quad) \times 4=3 \times(\quad)$
$5 \times 8=(\quad) \times 4=2 \times(\quad)$
$3 \times 10=(\quad) \times 6=2 \times(\quad)$
$6 \times 6=(\quad) \times 4=3 \times(\quad)$

Listen the dictation, write down and calculate:

1. $\qquad$
2. $\qquad$
3. $\qquad$
4. $\qquad$
5. $\qquad$

4 Insert the correct arithmetic operation signs (underline the equations where two different operation signs might be inserted and result still will remain the same):
324 $324=0$
$408 \square 0=408$
$222 \square 0=0$
$654 \square 1=655$
$528 \square 1=527$

## Homework Review

Open parentheses and try to simplify (find like terms and see if some of them can be canceled). HINT: if you do everything correctly, the answer will be just one letter!
$(\mathrm{a}+\mathrm{b}+\mathrm{c})-(\mathrm{c}-\mathrm{d}-\mathrm{e}-\mathrm{f}-\mathrm{g})-(\mathrm{a}+\mathrm{b})-(\mathrm{e}+\mathrm{d}+\mathrm{f}+\mathrm{g})+\mathrm{a}=$ $\qquad$

Insert the numbers to make the equations correct. Choose the numbers which are not the same as already used:
$\qquad$
$\qquad$ $\times$ $\qquad$ $=9 \times 4$
$6 \times 2=$ $\qquad$ $\times$ $\qquad$
$\qquad$ $\times$ $\qquad$ $=3 \times 8$
$4 \times 5=$ $\qquad$ $\times$ $\qquad$
$\qquad$ $\times$ $\qquad$ $=5 \times 9$

7 Find the perimeter of the following shape, if you know some of the sides:

## New Material I

Multiplication by 10 and 100
Recognize that in a multi-digit number, a digit in the ten's place represents the digit ten times as much as the same digit represents in the place to its right.
When we multiply by 10 , every digit should be increased 10 times; therefore, we should move a digit at the one's place to the left. Ones become tens, tens become hundreds, and hundreds become thousands.
a) Example I: $23 \times 10$
$23=20+3$
$23 \times 10=20 \times 10+3 \times 10=200+30=230$

b) Example II: $7 \times 100$
$7 \times 10 \times 10=70 \times 10=700$
Hundreds
Units Thousands Tens -

Show how you calculate:
a) $1 \times 10=$ $\qquad$ b) $1 \times 100=$
c) $10 \times 100=$ $\qquad$
d) $65 \times 10=$ $\qquad$
e) $65 \times 100=$ $\qquad$
f) $650 \times 10=$ $\qquad$
Q: What does " 0 " represent in each of these equations (in terms of a place value)?

By how much greater?
a) 5 and 50 ? $\qquad$ b) 3 and 300 ? $\qquad$ c) 15 and 1,500 ?
$\qquad$

10 How to multiply a number by $200,300400 \ldots . .$. ?
$7 \times 200=7 \times 2 \times 100$
First, we multiply the non-zero digits. $7 \times 2=14$
Then we multiply by 100 - place two zeroes at the end. $14 \times 100=1400$
$7 \times 200=1400$

11 By how much greater?
a) 20 and 40 ? $\qquad$ b) 20 and 400 ? $\qquad$ c) 2 and 4,000 ? $\qquad$

12 Solve the problems:
a) Four watermelons weigh 4 kg . How much 10 watermelons will weigh? $\qquad$
b) In the 10 stories building there are 5 two-bedrooms apartments and 4 one-bedroom apartments on each floor. How many apartments are in the building? $\qquad$
c) There were 10 plates on the table and $x$ strawberries on each plate. How many strawberries were on 10 plates? $\qquad$ . On 5 plates? $\qquad$
d) Find the perimeter of the rectangle with a width equal to 3 cm and a length 10 times longer.
$\mathrm{P}=$ $\qquad$

## Even and Odd numbers

Even numbers are multiples of 2.
Odd numbers are NOT multiples of 2.
If you sort odd number of candies between 2 children, you will always have 1 candy left.

The sum of two different even numbers equals 20. Find all possible solutions. Remember about commutative property of addition:

14 Sort out the numbers between 50 and 70 to the groups of even and odd numbers.
Even numbers: $\qquad$
Odd numbers: $\qquad$

## New Material II

## Symmetry.

In Mathematics, a meaning of symmetry defines that one shape is exactly like the other shape when it is moved, rotated, or flipped.

Example: You are told to cut out a 'heart' from a piece of paper. What would you do? Don't you simply fold the paper, draw one-half of the heart at the fold and cut it out to find that the other half exactly matches the first half? The heart carved out is an example of symmetry.

Reflection Symmetry (sometimes called Line Symmetry or Mirror Symmetry) is easy to spot, because one half of the shape is the reflection of the other half.
The Line of Symmetry (also called the Mirror Line) can be oriented in any direction.

Shapes may have several lines of symmetry, one line of symmetry or none. For example, a Triangle can have $\mathbf{3}$, or $\mathbf{1}$ or no lines of symmetry:

15 For each shape below, tell if the line drawn is a symmetry line or not? You can cut out the images and fold them along the dashed line to check.
a)

d)

g)

b)

e)

h)

c)

f)

i)

16 Some shapes you can fold in two different ways so that the sides meet.
The cross-shapes below have two different symmetry lines:

17 Draw as many different symmetry lines as you can into these shapes.

## Did you Know ...?

Symmetry (from the Greek word $\sigma 0 \mu \mu \varepsilon \tau \rho i^{\prime} \alpha$ - symmetria) is found everywhere in nature and is also one of the most prevalent themes in art, architecture, and design - in cultures all over the world and throughout human history. Symmetry is undoubtedly one of the most powerful and pervasive concepts in mathematics.
The maths concept of symmetry was derived from nature.
Everything around you are symmetrical, and we observe this day in and out but never put a thought to it.
Just imagine having one eye, one ear, one hand, or leg- nothing symmetrical bout it!!! We were
 created symmetrically.
