## MATH 5: HANDOUT 25 <br> GEOMETRY 5.

## Similar figures

Two figures are called similar of one of them can be obtained from the other by rescaling, or stretching (equally in all directions).

In similar figures all angles are the same, and all lenghts are increased in the same proportion. For example, if triangles $A B C$ and $A^{\prime} B^{\prime} C^{\prime}$ are similar, then

$$
\begin{aligned}
& \angle A=\angle A^{\prime}, \quad \angle B=\angle B^{\prime} \quad \angle C=\angle C^{\prime} \\
& A^{\prime} B^{\prime}=k A B, \quad A^{\prime} C^{\prime}=k A C, \quad B^{\prime} C^{\prime}=k B C
\end{aligned}
$$

The number $k$ is called the similarity coefficient.

## Similarity Tests for triangles

Axiom 1 (AAA Rule). If three angles of one triangle are equal to corresponding angles of another triangle, then the triangles are similar.

For example, if $A B C, A^{\prime} B^{\prime} C^{\prime}$ is a right triangles with $\angle C=\angle C^{\prime}=90^{\circ}, \angle A=\angle A^{\prime}=30^{\circ}$, then these triangles are similar.

Another example is shown in the figure to the right. Let lines $l=A B$, $l^{\prime}=A^{\prime} B^{\prime}$ be parallel. Then triangles $A B C$ and $A^{\prime} B^{\prime} C$ are similar: indeed, by the theorem about alternate angles, we have $\angle A=\angle A^{\prime}$, $\angle B=\angle B^{\prime}$.
