
NAME:

The Equator is an imaginary line on the Earth's surface which is at equal distance from the North Pole and South Pole.

Explore the globe to find and list any 7 (seven) “places” located at or near the equator (look for cities, small countries, islands, mountains or volcanoes, lakes, etc).

My Example: _____ Isabela Island (*Isla Isabela*) of Galapagos, Ecuador _____

If you do not have a real globe at home, you can use Google Earth 😊 (earth.google.com) just make sure to select the “everything” view in the menu to see the names of all places as well as “turn on gridlines” to see the equator.

1. _____

2. _____

3. _____

4. _____

5. _____

6. _____

7. _____
