## MATH 7: HOMEWORK 13 Vieta's formulas January 26, 2026

## 1. Solving the complete quadratic equation by smart guessing

If  $x_1$  and  $x_2$  are the roots, then the quadratic equation can be written from standard into factored form:

$$ax^2 + bx + c = a(x - x_1)(x - x_2)$$

For the special case when a = 1, we set a = 1 and then multiplying the expressions in the right hand side, we get:  $x^2 + bx + c = (x - x_1)(x - x_2) = x^2 - x_1 - x_2x + x_1x_2 = x^2 - (x_1 + x_2)x + x_1x_2$ 

From comparing the numbers in front of the same powers of x the coefficients we can get the following:

$$x_1 + x_2 = -b$$
$$x_1 x_2 = c$$

• for equation in standard form:  $ax^2 + bx + c = 0$ 

The roots of the quadratic equation are related to the coefficients:  $x_1x_2 = \frac{c}{a}$  and  $x_1 + x_2 = -\frac{b}{a}$ 

In the special case when a=1,  $x_1x_2=c$  and  $x_1+x_2=-b$ 

$$x^2 + bx + c = 0$$

$$x_1 x_2 = c$$
,  $x_1 + x_2 = -b$ 

## Homework problems

*Instructions:* Please write solutions on a *quadrille sheet of paper*. Solutions should include explanations. I want to see how you arrived at this answer, and some justification for why this is indeed the answer. So **please include sufficient explanations**.

1. Find the roots of the equations  $x_1$  and  $x_2$  using Vieta's formulas. After that, write the equation in a factorized form

as 
$$a(x - x_1)(x - x_2)$$
.

a. 
$$x^2 - 5x + 6 = 0$$

b. 
$$x^2 + 8x - 9 = 0$$

c. 
$$2x^2 + 4x - 6 = 0$$

2. Let x and y be some numbers. Use the formulas for fast multiplication to rewrite the following expressions using only (x + y) = B and xy = C, where B and C are just number. To do that, present the expressions as sums and/or products of x and y, then substitute the sums/products with B and C. No x and y are allowed in the answers! Example:  $x^2 + y^2 = x^2 + y^2 + 2xy - 2xy = (x + y)^2 - 2xy = B^2 - 2C$ 

We completed the square using the formula:  $a^2 \pm 2ab + b^2 = (a \pm b)^2$ 

a. 
$$(x - y)^2 =$$

b. 
$$\frac{1}{x} + \frac{1}{y} =$$

c. 
$$\frac{1}{x-1} + \frac{1}{y-1} =$$

d. (\*) 
$$x^3 + y^3$$

Hint: first compute  $(x + y)(x^2 + y^2)$ 

3. Let  $x_1$ ,  $x_2$  be the roots of the equation  $x^2 + 5x - 7 = 0$ . Using the Vieta's formulas, find the values of the expressions <u>without</u> explicitly calculating  $x_1$  and  $x_2$ 

a. 
$$x_1^2 + x_2^2 =$$

b. 
$$(x_1 - x_2)^2 =$$

d. (\*) 
$$x_1^3 + x_2^3 =$$

4. Solve the following equations.

a. 
$$x^2 - 5x + 6 = 0$$

$$c. \quad \sqrt{2x + 1} = x$$

c.  $\frac{1}{x_1} + \frac{1}{x_2} =$ 

d. 
$$x + \frac{2}{x} = 3$$

b. 
$$5x^2 = 8x - 3$$

- 5. Solve the biquadratic equation:  $x^4 3x^2 + 2 = 0$
- 6. Prove the following inequalities:
  - a. for any a > 0, prove that  $a + \frac{1}{a} \ge 2$ ,

with equality only when a = 1.

b. Show that for any  $a, b \ge 0$ , one has

$$\frac{a+b}{2} \ge \sqrt{ab}.$$

The left hand side is usually called the arithmetic mean of a, b; the right hand side is called the geometric mean of a, b.

Hint: I suggest you "remove" the denominator or the radicals (square roots), write the quadratic equations into factorized form, with zero on one side of the new inequality. Try your best, we will be solving inequalities soon.
