

Newton's Laws

- **Newton's 1st Law (Same as Galileo's law of inertia): No force => no acceleration.**

"An object at rest stays at rest and an object in motion stays in motion with the same speed and in the same direction unless acted upon by a force."

$$\vec{F} = 0 \quad \Rightarrow \quad \vec{v} = \text{const}$$

- **Newton's 2nd Law:**

"Force equals mass times acceleration"

$$\vec{F} = m\vec{a}$$

- **Newton's 3rd Law:**

"Any Force of action has an equal and opposite Force of reaction"

$$\vec{F}_{B \rightarrow A} = -\vec{F}_{A \rightarrow B}$$

Unit of force is called Newton (N)

$$1N = 1 \frac{\text{kg} \cdot \text{m}}{\text{s}^2}$$

Examples of Forces

(Gravitational force.
 $g=9.8 \text{ m/s}^2$ is gravitational acceleration)

Forces are vectors! The total force is the **vector sum** of all applied forces:

$$\vec{F}_{total} = \vec{N} + \vec{T} + m\vec{g}$$

Adding vectors

There are two ways of thinking about **vectors**:

- **Geometrically**, vector is a directed line segment. It has direction and magnitude.
- **Algebraically**, vectors can be written as a list of numbers: their X, Y and Z components. For instance (3,4,-5).

To add vectors A and B geometrically, you can use “triangle” or “parallelogram” rules:

Homework 9

Problem 1.

Find the total force acting on a cat (graphically)

When solving the problem below follow these steps:

- Make picture with all forces acting on a rocket shown.
- Use 2nd Newton's Law to find acceleration. DO NOT SUBSTITUTE NUMBERS! Try to get a general formula for acceleration a , in terms of F , M , and g .
- Now substitute appropriate numbers in your formula and get result for both (a) and (b)

Problem 2

The Apollo mission to Moon was launched by a very powerful rocket called Saturn V. The total mass of the rocket right before launch was $M=2.8 \times 10^6 \text{ kg}$. Total thrust (propulsion force) of 5 engines of the first stage is $F=34 \times 10^6 \text{ N}$ (Newtons). The rocket is launched vertically upward.

- Find the **total force** acting on the rocket and acceleration of the rocket right after the launch. Neglect air resistance.
- Similarly to part (a), find acceleration right before the fuel of the first stage is fully burned. The mass of the fuel is $m=2.1 \times 10^6 \text{ kg}$
