

3.

Lesson 13. Classwork

WARM-UP

1.	Calculate using property of addition: tr	y to make it easier to calculate!
	7 + 16 + 3 =	
	11 + 8 + 9 =	
	7 + 6 + 7=	
	48 + 37 + 12 + 13 =	
	50 + 29 + 21 =	
2.	Write down the numbers using digits two hundred ninety six three hundred two six hundred twenty seven one hundred eighty	s: eighty six forty six five hundred forty eight nine hundred sixty

a) Lisa's bag fits into Ann's bag. Ann's bag fits into Clara's bag. Whose bag is the biggest?

b) Ben's tea is colder than Paul's tea but warmer than Christina's tea. Whose tea is the coldest?

Operations, Inverse operations

NEW MATERIAL

In mathematics, **inverse operations** are operations that 'undo' each other. Most operations we use have an inverse. Addition and subtraction are inverse operations – they "undo" each other.

4.

a) Look at the pictures below and describe what Jack did with the toys? Can this operation be reversed?

b) Name the operations performed on the picture below. Can this operation be reversed?

A chef has cut some vegetables. Can these operations be reversed?

6.

5.

Write the inverse operations for each action:

To put on a shirt	
To break a toy car	
To climb up a tree	
To pour water into a cup	
To turn on a TV set	

7.

Use the inverse operation to solve an equation:

x + 37 = 21

_____=

=

=

_____= _____

=

x - 15 = 205

=_____

Example: x + 12 = 15x + 12 - 12 = 15 - 12x = 3 \checkmark 3 + 12 = 15

Solve:

Solve:

8.

Mind reading game.

1. Think of any number from 1 to 50.

2. Add 25 to it._____

3. Subtract 20 from a product._____

4. Subtract 6 from a product_____

5. Add 50 to a product_____

6. Subtract 14 from a product_____.

What did you end up with?

Tell me the result and I'll tell you the number you thought of.

Lesson 13 Operations, Inverse operations					
REVIEW					
9		,			
Number the order of operations in the expressions.					
$m + (n - k) \qquad \qquad m + (n - k - t) + k$					
	(m +	- n) – k	m+n-(k-t+k)		
10.	There are 3 books o shelf?	n a shelf. <i>One</i>	book is added. How many books are on the		
There are <i>a</i> books on a shelf. <i>One</i> book is added. How many books are on the shelf?					
There are <i>a</i> books on a shelf. <i>b</i> books are added. How many books are on the shelf?					
There are <i>3</i> books on one shelf and <i>6</i> books on another. How many more books are on the second shelf than on the first?					
Capital letters are used to denote sets: A, B					
	Lowercase	etters are used	to denote elements of sets: a, b		
Curly braces { } denote a list of elements in a set.					
	Exam	ple: the set of l	etters: { a , b , c ,, x , y , z }		
11	a) How many eleme	ents are in the s	et of days of the week?		
•••	b) How many eleme	ents are in the s	et of months?		
c) What set is larger: set of all letters in the alphabet or set of all vowels? Draw Venn diagram for both sets.					
12.	Jennifer listed the set wrong with this set?	et of all letters	in the word "library" as shown below. What is		
	$\{l, i, b, r, a, r, y\}$				

	Lesson 13	Operations, Inverse operations		
	Challenge yourself			
16	250	00 years ago, in ancient Mesopotamia, ones were written as Δ , tens as \blacktriangleleft , and as $▼$. How would they write number 124 in Mesopotamia those days?		
a) $\blacktriangleleft \blacktriangledown \blacktriangle \Delta \Delta \Delta \Delta$				
	b) $\mathbf{\nabla} \mathbf{\nabla} \mathbf{\triangleleft} \mathbf{\triangleleft} \Delta \Delta \Delta \Delta$			
	c) $\mathbf{\nabla} \triangleleft \triangleleft \Delta \Delta \Delta \Delta$			
	d) $\mathbf{\nabla} \Delta \Delta \Delta$	< <▼		
	e) ▼ ▼ Δ⊿	ΔΔΔ		

Did you know ...

Roman numerals originated, as the name might suggest, in ancient Rome. There are seven basic symbols: I, V, X, L, C, D and M. The first usage of the symbols began showing up between 900 and 800 B.C.

Seven different letters: I, V, X, L, C, D and M represent 1, 5, 10, 50, 100, 500 and 1,000. We use these seven letters to make thousands of different numbers.

Roman numerals are not without flaws. For example, there is no symbol for zero, and there is no way to denote fractions.

1 = 1	8 = VIII	60 = LX
2 = II	9 = IX	70 = LXX
3 = III	10 = X	80 = LXXX
4 = IV	20 = XX	90 = XC
5 = V	30 = XXX	100 = C
6 = VI	40 = XL	500 = D
7 = VII	50 = L	1000 = M

Lesson 13

Operations, Inverse operations

Forming numbers:

 $VI = 6 \quad (5 + 1 = 6)$ LXX = 70 (50 + 10 + 10 = 70) MCC = 1200 (1000 + 100 + 100 = 1200)

 $IV = 4 \quad (5 - 1 = 4)$ $XC = 90 \quad (100 - 10 = 90)$ $CM = 900 \quad (1000 - 100 = 900)$

Roman numerals were used to record numbers in stone, art and coins. However that was a long time ago, these days they are used for list items, chapter headings, copyright dates and to mark film sequels such as the *Star Wars* films.

Roman numerals are also used on clock and watch faces.

Today, Roman numerals appear in building cornerstones, movie credits and titles. They are also used in names of monarchs, popes, ships and sporting events, like the Olympics and the Super Bowl.
