Math battle 9.

- 1. Is it possible to put in each vertex of any given triangle *ABC* a number such that for every edge, its length is equal to the sum of numbers at its endpoints?
- 2. 10 students are solving problems of a math competition. Each of 10 problems was solved by the same number of students, but no two students have solved the same number of problems. One of the students, Max, has solved problems 1 through 5 and has not solved problems 6 through 9. Has Max solved problem 10?
- 3. Igor has found a thirteen-digit prime number such that the first twelve digits (from the left) are all identical. What is the thirteenth digit?

1

4. Solve the following equation: 2019 fractions
$$\begin{cases} \frac{1}{1 - \frac{1}{$$

5. Let *ABC* be a right triangle, with $\angle A = 90^{\circ}$, and $K \in BC$ be such that AB = AK. If we know that segment *AK* bisects the angle bisector *CL*, what are the angles of $\triangle ABC$?
