

NaCl

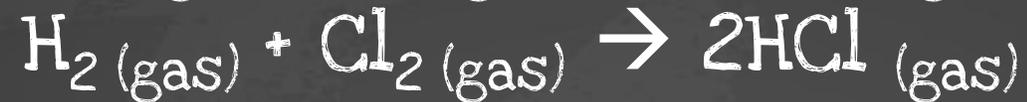

(a)

(b)

58.5 g of NaCl in 1 L,  
We have 1 molar solution of  
sodium chloride. If we have 0.25  
L of the solution, the sodium  
chloride concentration is 4  
mol/L

Equal gas volumes (at equal temperature and pressure) contain the same number of particles

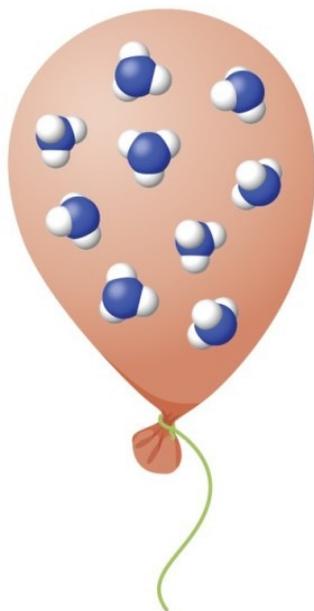

- 1 mole of any gas takes a volume of 22.4 liters at “normal conditions “. This is a molar gas volume under normal conditions.
- Normal conditions are temperature of 0°C (273 K) and pressure of 1 atm (101 325 Pa)

# Avogadro's Law

Equal volumes of ideal gases measured at the same temperature and pressure contain the same number of molecules.

He (4 g)

NH<sub>3</sub> ( 17 g)

O<sub>2</sub> (32 g)

How can we use this law?

$$m = k d$$

$$k = m/d$$

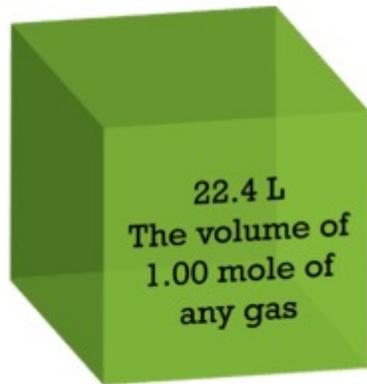

Molecular weight (m) of any gas will be proportional (k – proportionality coefficient) to its density (d).

We can change molecular weight to molar weight (g/mol)

$$k = M/d$$

$$K = 32/1.427 = 22.4 \text{ L/mol}$$

	Density, g/l	M, molar mass, g/mol	Coefficient, k
H <sub>2</sub>	0.0894	2	~22.4
O <sub>2</sub>	1.427	32	~22.4

22.4 L - the volume that one mole of any gas occupy under normal conditions.

# Clapeyron-Mendeleev equation

Under standard conditions  $RT = 22.4$  (0.0821x273), pressure = 1atm. In 22.4 L we will have  $n = 1$ .  
 $n = pV/RT$   
 $n = 1 \times 22.4 / 22.4 = 1$   
22.4 L contains 1 mole of any gas.

$$pV = nRT$$

$n$  - gas mole number

$p$  - gas pressure (atm)

$V$  - gas volume (liters)

$T$  - temperature (K)

$R$  - gas constant (0.0821 l x atm/mole x K)

# Example

A closed flask of 2.6 L contains oxygen under the pressure of 2.3 atm and temperature of 26°C.

How many moles of O<sub>2</sub> are there in the flask?

$$pV = nRT$$

$$n = PV/RT$$

$$n = (2.3 \text{ atm} \times 2.6 \text{ L}) / (0.0821 \text{ (L} \times \text{atm/mole} \times \text{K)} \times 299 \text{ K})$$

$$273 \text{ K} + 26^\circ\text{C} = 299 \text{ K}$$

Ideal Gas Equation is

$$PV = nRT$$

$n = \text{no. of moles}$

$$P \times V = \frac{\text{mass}}{\text{molar mass}} \times R \times T$$

$$n = \frac{\text{weight / mass}}{\text{molar mass.}}$$

$$\Rightarrow P \times V = \frac{m}{M} \times R \times T$$

Let molar mass =  $M$   
mass =  $m$ .

$$\Rightarrow M = \frac{m \times R \times T}{P \times V}$$

we know that density =  $\frac{\text{mass}}{\text{Volume}} = \frac{m}{V} \therefore d = \frac{m}{V}$   
Substitute the value  $\frac{m}{V}$  with  $d$

$$\therefore \boxed{M = \frac{d \times R \times T}{P}}$$
