

# 2nd Newton's Law for Rotation

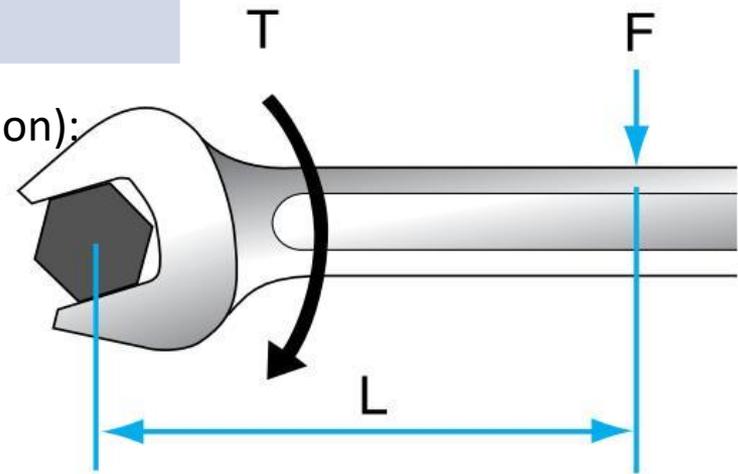

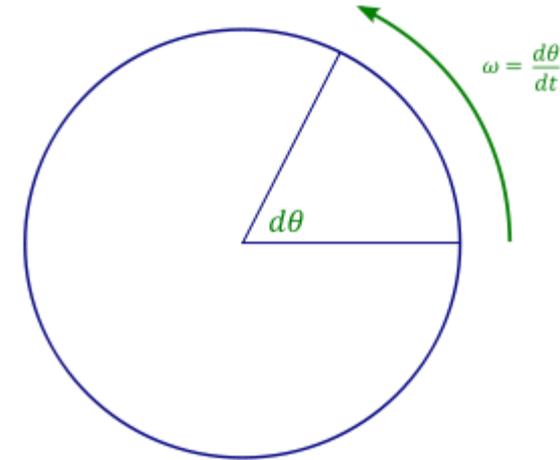

Linear motion	Rotation
Coordinate: $x$	Angle (in radians): $\theta = l/R$
Velocity: $v = \Delta x/\Delta t$	Angular velocity: $\omega = \Delta\theta/\Delta t$
Mass: $m$	Moment of Inertia: $I$
Acceleration: $a = \Delta v/\Delta t$	Angular acceleration: $\alpha = \Delta\omega/\Delta t$
Force, $F$	Torque, $T = F \times l$

2<sup>nd</sup> Newton's Law:

$$F = ma$$

2<sup>nd</sup> Newton's Law (for rotation):

$$T = I \frac{\Delta\omega}{\Delta t} = I\alpha$$

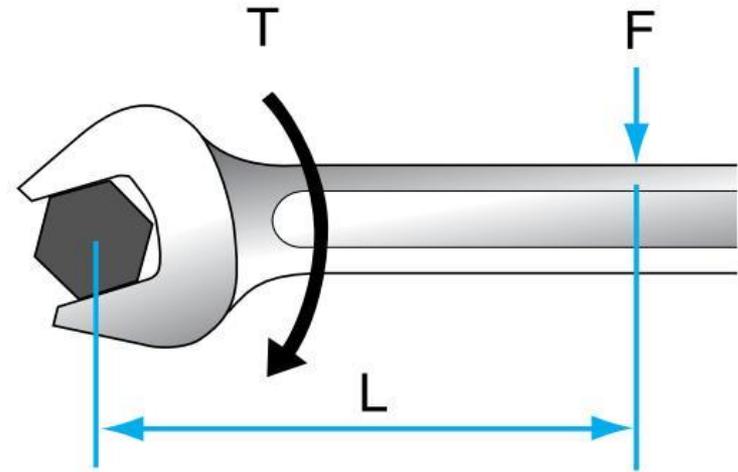

Torque  $T = F$  (Force)  $\times$   $L$  (Length)

# Statics

Consider a rigid object in equilibrium. Since it has zero acceleration, and no rotation, the sum of all forces and torques applied should be 0:

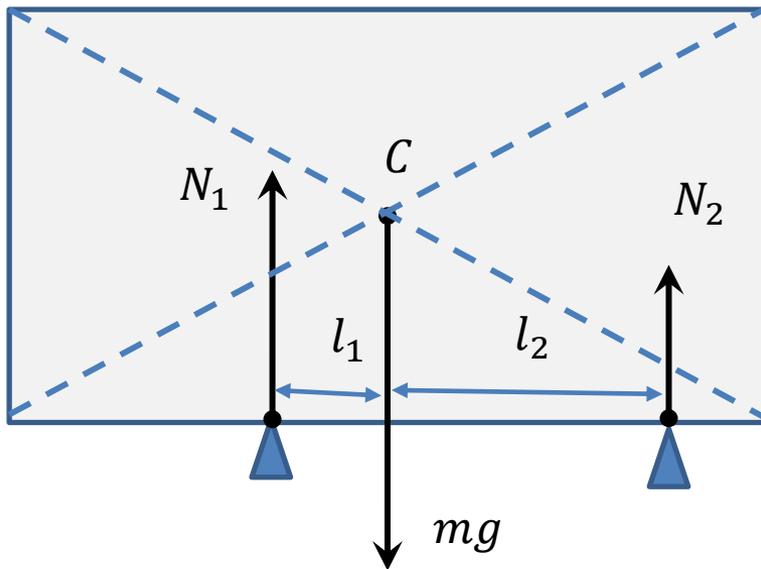

$$\sum \vec{F} = 0$$

$$\sum \vec{T} = 0$$

Torque  $T = F$  (Force)  $\times$   $L$  (Length)

Example: whiteboard on two holders:

- Total force = 0:

$$-mg + N_1 + N_2 = 0$$

- Total torque = 0.

$$N_2 l_2 - N_1 l_1 = 0$$

The torque is with respect to point C (center), thus  $mg$  produces zero torque (no lever). “Counter-clockwise” is positive rotation. Solving above equations:

$$mg = N_1 + N_2 = N_1(1 + l_1/l_2)$$

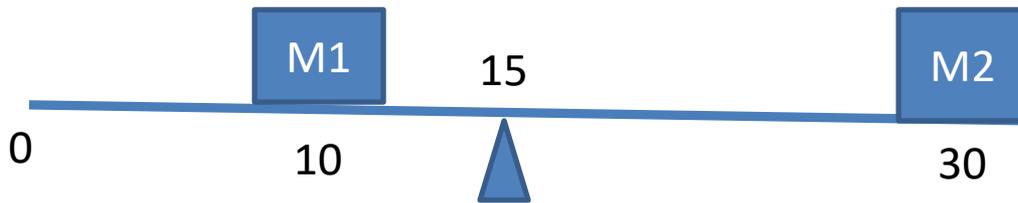

$$N_1 = mgl_2/(l_1 + l_2)$$

$$N_2 = mgl_1/(l_1 + l_2)$$

# Homework

## Problem 1

A ruler is used to balance two weights as shown in figure 1. The ruler total length is 30 cm, it is supported at its center (at 15 cm mark). Mass  $M_1=30$  g, is located at 10 cm mark. The other mass,  $M_2$  is at 30 cm mark. Find  $M_2$

**Problem 2 (experimental)** Use a ruler and a pencil to find the ratio of masses of US quarter and US penny. You may use other two coins if you wish, Its OK to use several identical coins. Make a picture of your experiment, describe procedure and give your results.
