James Webb Telescope

helps observe VERY FAR AWAY objects

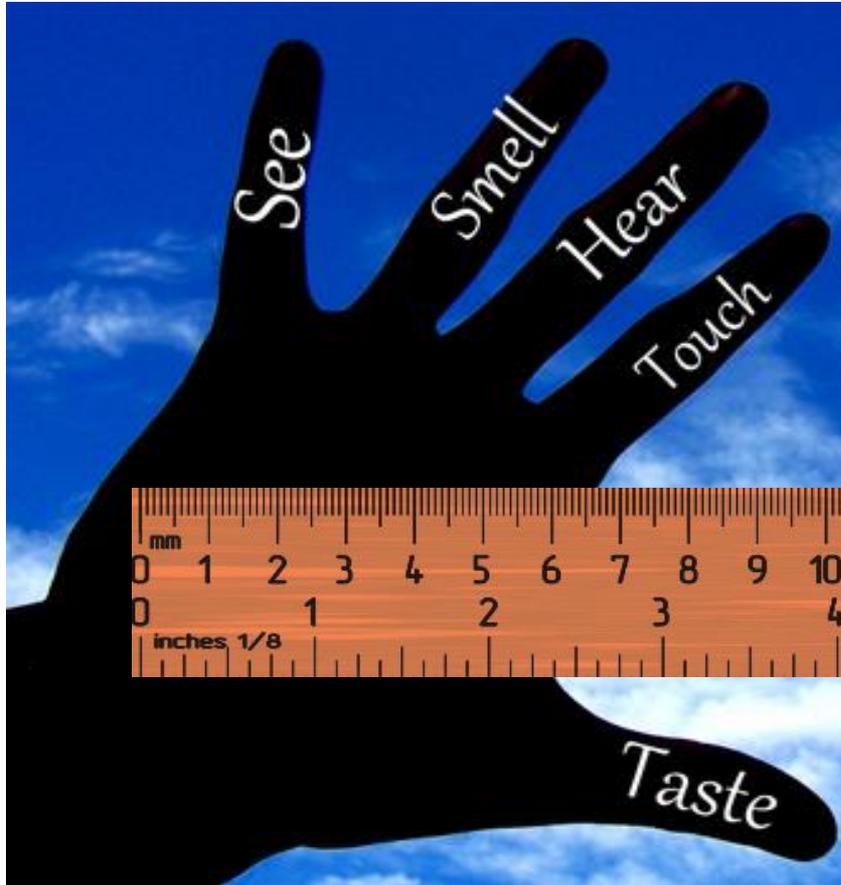

Electron Microscope

helps observe VERY SMALL objects

Evidence is based on Observation

- Observation is describing an object or event using your five senses (*what you see, hear, smell, taste, touch*) or measurement (*numbers*).
- Modern science employs *sensors* and *detectors* to make observations.
- Information gathered during an observation is called **data** (singular form *datum*).

CONCLUSION!

Describe the Elephant

*Observation
should NOT
include
opinion!*

It weighs 480 kilograms.

It has large ears and long trunk.

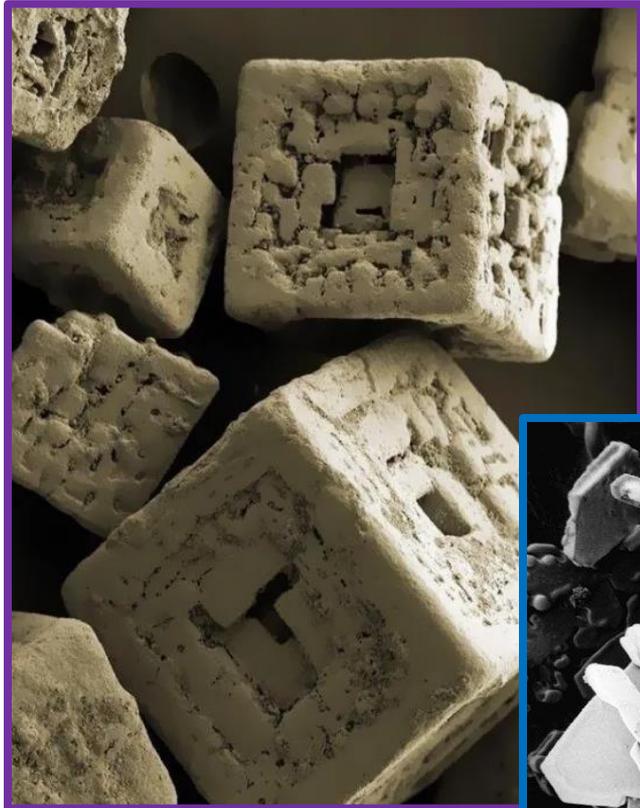

It has gray wrinkly skin.

~~**It is very cute!**~~

It is young.

It is about 1.5 yards tall.

SNOW

Qualitative vs Quantitative Data

Qualitative (letters)

- **Descriptions** using words.
- Data which can be **observed** but **not measured**.
- What the object is *like*: texture, smell, taste, appearance, etc.

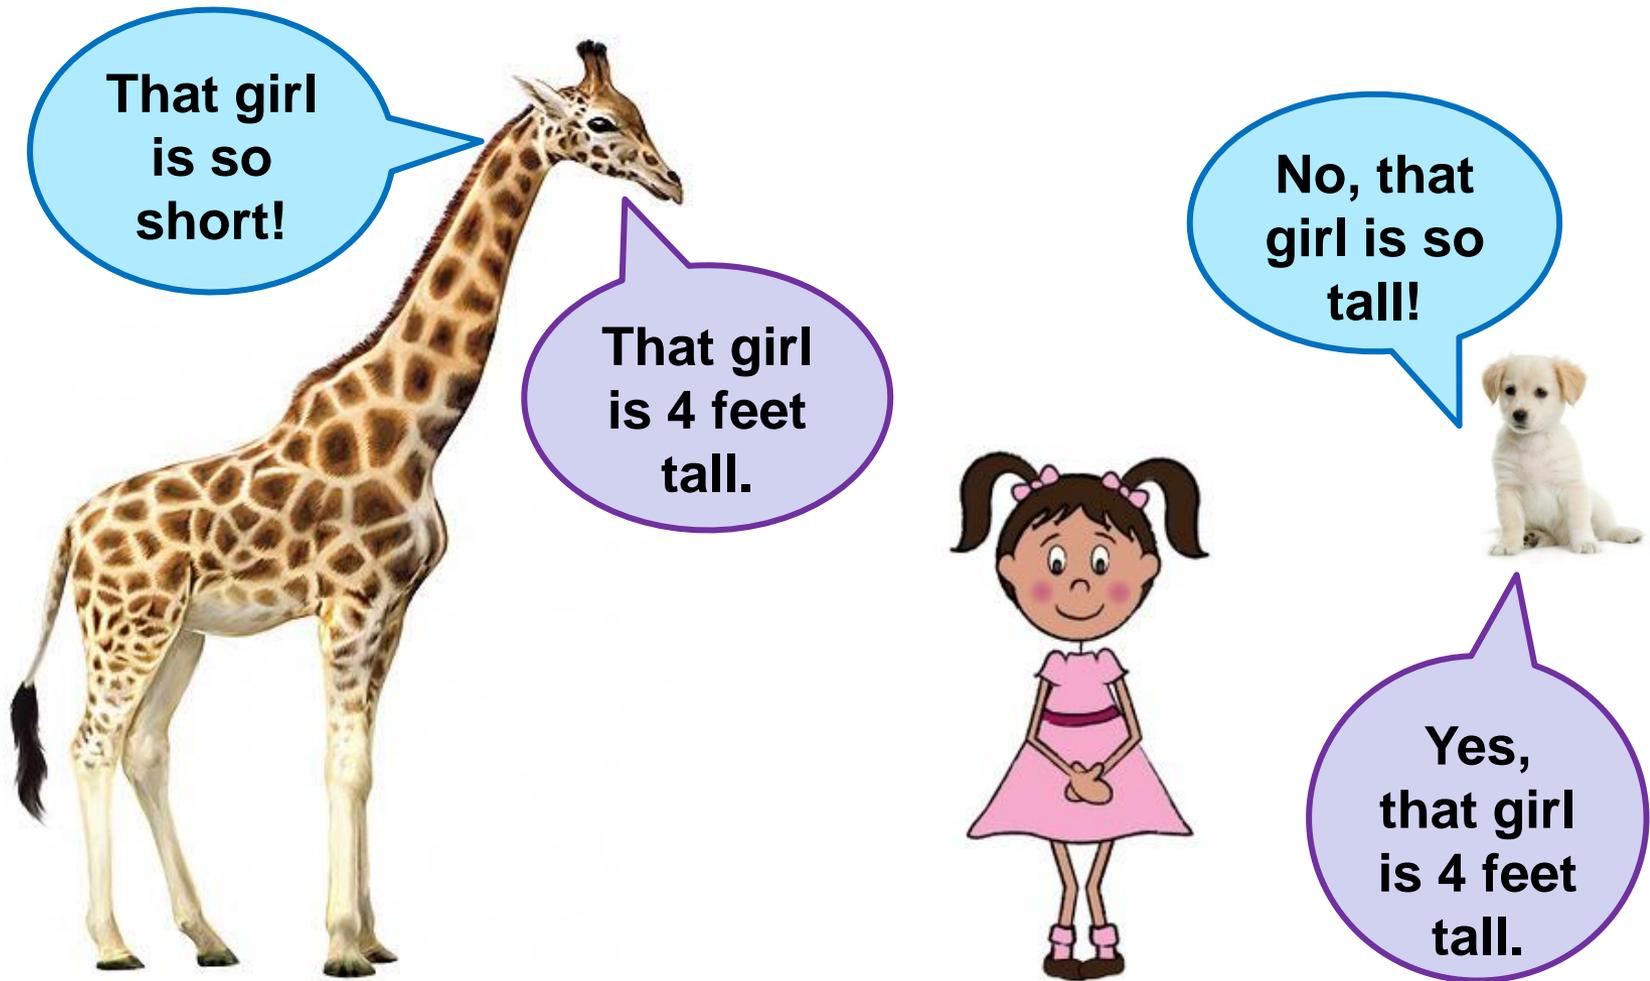

Subjective, relative

Quantitative (numbers)

- **Specific numbers**.
- Data which can be **measured**.
- Length, height, area, volume, weight, speed, time, temperature, humidity, sound levels, cost, age, etc.

Objective, specific

Qualitative observations are **subjective**

Quantitative observations are **objective**

Observation depends on observer

- Location and size of an observer
- Observer limitations

can only see visible light

can see ultraviolet light
