

How many states of matter can you find in each picture?

Matter in Chemistry

Ordinary matter is composed of atoms and groups of atoms *bonded* together, called molecules.

- There are many different types of atoms.
- Consequently, there are many possible combinations of two or more atoms that can chemically bond.

Molecule

Molecules are neutral groups of two or more atoms held together by chemical bonds.

- Molecules can be thought of as the **smallest identifiable physical unit** of a chemical substance.

- Molecules as components of matter are common in organic substances. They also make up most of the oceans and atmosphere.

- However, the **majority of familiar solid substances on Earth**, including most of the minerals that make up the crust, mantle, and core of the Earth, contain many chemical bonds, but **are not made of identifiable molecules**.

Simple inorganic molecules

Table
Salt
crystal

Chemical Substance

A chemical *substance* is a form of matter that has a definite chemical composition throughout and distinct characteristic properties.

glass

gold ingots

honey

liquid nitrogen

All ordinary matter can be classified *chemically* as either a *pure substance* or a *mixture*.

Classification of Substances

- Elements: substances that are made from **one type of atom** only.
How many types are there?

- Compounds: substances that are made from **more than one** type of atom **chemically bonded** together.

- Mixtures: substances that are made from **more than one** type of atom **combined physically**, but not chemically bonded.

Periodic Table of Elements

today, there are **118** known elements

Elements and Compounds

- Sodium is an **element**.
- Chlorine is an **element**.
- When **sodium** and **chlorine** **bond** they make up the **compound sodium chloride**, commonly known as **table salt**.

Compounds have *different properties than the elements that make them up:*

for example, table salt has different properties than **sodium**, an **explosive metal**, and **chlorine**, a **poisonous gas**.

Elements, Compounds, Mixtures

- Hydrogen is an **element**.
- Oxygen is an **element**.
- When **hydrogen** and **oxygen** **bond** they make the **compound water**.
- When **salt** and **water** are **combined**, a **mixture** is created.

**Components in mixtures
retain their individual
properties.**

Water is a **compound**

Ocean water is a **mixture**

Types of Mixtures

- **Homogeneous** – composition of the mixture is the same throughout; only one state of matter is present.

- **Heterogeneous** – composition is not uniform throughout.
