

Math 4. Class Work 19

Rate problems

These kinds of problems are related to the amount of work done per unit of time; we can call it “rate problems”. To solve the problem, we have to find out what part of the work is done in units time: 1 minute, 1 hour, 1 day

Mary can eat her birthday cake in 10 minutes, and Peter can eat the same cake in 15 minutes. How fast will they eat the same cake together?

The time unit here is minute.

If Mary can eat the whole cake in 10 minutes, she only eats $\frac{1}{10}$ of the cake in one minute.

Peter will eat $\frac{1}{15}$ of the cake in 1 minute. If they will start eating the cake simultaneously, each minute they will eat

$$\frac{1}{10} + \frac{1}{15} = \frac{3}{30} + \frac{2}{30} = \frac{5}{30} = \frac{1}{6}$$

The rate with which the cake will be disappearing is $\frac{1}{6}$ per minute:

$$x(\text{minutes}) \cdot \frac{1}{6}(\text{part of the cake}) = 1(\text{whole cake})$$

So, they will need exactly $x = 1(\text{whole cake}) : \frac{1}{6}(\text{parts}) = 1 \cdot 6 = 6 \text{ minutes}$

Speed, distance, time and relation between units

$$S = vt; \quad v = \frac{S}{t}; \quad t = \frac{S}{v};$$

1 kilometer (km) = 1000 meters(m)

1 meter = 100 centimeters (cm)

1 hour (h) = 60 minutes(min)

1 minute (min) = 60 seconds(s)

Geometry notations

$k = \text{Circ}(M, r=4 \text{ cm})$ - a circle with a center at point M and a radius of 4 cm.

$\{P, Q, R\}$ - a list of points, $|AB| = 3 \text{ cm}$ – the size of a segment \overline{AB}

\cap - intersection symbol, \parallel - parallel lines, \in - belongs to, an element of a list or object

Problems

1. A bathtub fills with cold water in 6 minutes 40 seconds, with hot water in 8 minutes. Additionally, if the plug is removed from the full bathtub, the water will drain out in 13 minutes 20 seconds. How much time will it take to fill the bathtub completely, assuming both taps are open but the bathtub is not plugged?

2. The distance between two villages is covered by a pedestrian in 60 minutes and by a cyclist in 20 minutes. How many minutes will it take for them to meet if they set off simultaneously towards each other from these villages?
3. A cat can eat the sausage in 10 minutes, a dog can eat it in 2.5 minutes. How fast will they eat the sausage together?

4. Mary, Peter, and Julia are going to do spring cleanup in their garden. Mary can do the job in 4 hours, Peter can do the full clean up in 3 hours, Julia needs 6 hours to do the job. How fast will they do it together?
5. A swimming pool can be filled by pump A in 3 hours and by pump B in 6 hours, each pump working on its own. At 9 am pump A is started. At what time will the swimming pool be filled if pump B is started at 10 am?
6. Using only a ruler and a compass plot
 - a) Plot a straight line $KT \perp m$
 - b) Divide a segment AB into two equal parts
7. Solve the equations
 - a) $2x + |x + 1| = 3$
 - b) $\frac{2x+1}{x-1} = 4$

Additional Problems

8. The older brother can clean up the room in 2 hours, the younger brother can completely ruin it in 3 hours. In how many hours will the room be cleaned if they are supposed to do it together before they exit the room?
9. To bake 100 pancakes, Mom needs 30 minutes, while Dad needs 40 minutes. Son can eat 100 pancakes in an hour. Mom and Dad continuously make pancakes without stopping, while Son continuously eats them. After how much time from the beginning of this process will there be exactly 100 pancakes on the table?
