

MATH 5: HANDOUT 24

PROBABILITY IV: COUNTING, INCLUSION-EXCLUSION, AND MORE (SUMMARY)

Counting and Probability

Counting techniques let us compute probabilities: $P = \frac{\text{favorable outcomes}}{\text{total outcomes}}$.

Example: 50 people sit randomly. P (all in assigned seats)?

$$P = \frac{1}{50!}$$

Example: 4-digit PIN (repeats allowed). P (all digits different)?

$$P = \frac{P(10, 4)}{10^4} = \frac{5,040}{10,000} = 50.4\%$$

Example: 4-digit PIN (no repeats). P (PIN is 1234)?

$$P = \frac{1}{P(10, 4)} = \frac{1}{5,040}$$

Example: 5 friends in a row. P (Alice & Bob adjacent)?

$$P = \frac{4! \times 2}{5!} = \frac{48}{120} = \frac{2}{5}$$

Inclusion-Exclusion Principle

When two events overlap, outcomes in both would be counted twice without the correction.

Theorem 1 (Inclusion-Exclusion (two events)).

$$P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B)$$

Example: 100 students: 28 speak Spanish, 30 speak German, 8 speak both. Spanish or German: $28 + 30 - 8 = 50$.

For three events:

$$P(A \text{ or } B \text{ or } C) = P(A) + P(B) + P(C) - P(A \text{ and } B) - P(A \text{ and } C) - P(B \text{ and } C) + P(A \text{ and } B \text{ and } C)$$

Example: 50 students: 20 soccer, 15 basketball, 12 tennis; 6 soccer+basketball, 4 soccer+tennis, 3 basketball+tennis, 2 all three.

$$20 + 15 + 12 - 6 - 4 - 3 + 2 = 36 \text{ play at least one sport.}$$

Systematic Dice Counting

Always list outcomes in order to avoid missing any.

Example: 2 dice, $P(\text{sum} \leq 7)$?

Sums 2–7 give $1 + 2 + 3 + 4 + 5 + 6 = 21$ outcomes.

$$P = \frac{21}{36} = \frac{7}{12}$$

Example: 3 dice, P (all different)?

Choose without repetition:

$$P = \frac{6 \times 5 \times 4}{6^3} = \frac{120}{216} = \frac{5}{9}$$

Homework

- In a group of 100 students: 28 speak Spanish, 30 speak German, 42 speak French. Also, 8 speak Spanish and German, 10 speak Spanish and French, 5 speak German and French, and 3 speak all three languages.
 - Draw a Venn diagram showing this information.
 - How many students speak at least one of the three languages?
 - How many students don't speak any of these languages?
- Suppose you have a standard die.
 - What is the probability that when you roll once, the number is less than 5?
 - What is the probability that when you roll once, the number is less than 7?
 - What is the probability that when you roll twice, at least one result is a 6?
 - What is the probability that when you roll three times, all results are odd?
- You roll 2 dice.
 - What is the probability that the sum is at most 7?
 - You and a friend play a game: you win if the sum is at most 7, otherwise your friend wins. The loser pays \$1. Would you rather be the one who wins on "at most 7" or "more than 7"? Explain.
 - How would you adjust the payments to make this game fair?
- The Two-Child Problem. A family has two children. You are told that at least one of them is a boy. What is the probability that both children are boys?
Hint: List all possible combinations of two children (BB, BG, GB, GG) and eliminate the impossible ones.
Note: This problem is famous for being tricky! Think carefully about what information you're given.
