

Summary: Structure of Matter

Question #1:

What's
inside
a nucleus?

Question #2: Is **planetary model** of the atom *good enough* to explain all experimental observations?

Rutherford Transmutation Experiments

- **1919**: “splitting the atom” - it is possible to change one element into another by striking it with energetic alpha particles.
- **Early 1920's**: a number of experiments, *transmuting* one atom into another (ex. Nitrogen into Oxygen)
 - Observation #1: in every case, **hydrogen nuclei were emitted** in the process.
 - Therefore **hydrogen nucleus must play a fundamental role in atomic structure.**
 - Observation #2: the positive charge of any nucleus could be accounted for by an integer number of hydrogen nuclei.
 - Observation #3: the total mass of any given atomic nucleus IS LARGER than the total mass of the number of hydrogen nuclei corresponding to its charge.
 - Therefore the nucleus must also contain a **neutral particle.**

Inside a Nucleus

- Rutherford, 1920: discovery of a **proton** (Greek: “first”), a **positively charged** subatomic particle.
- 1920-1932: search for a *neutral* particle.
- Chadwick, 1932: detected **zero charged** particles with about the same mass as the proton, eventually called **neutron** (**1935 Nobel Prize in Physics**).

**Atomic
Nucleus
Structure**

Atom $\sim 10^{-10}\text{m}$

Nucleus $\sim 10^{-14}\text{m}$

Proton $\sim 10^{-15}\text{m}$

Neutron $\sim 10^{-15}\text{m}$

Wave Model of the Atom (contemporary model)

Atom has a small positively charged nucleus surrounded by a large region (“*electron cloud*”) in which there are enough electrons to make an atom neutral.

Quantum Theory states that the electrons inside an atom possess both particle- and wave-like properties:

- There is always an **integer number of electrons** orbiting the nucleus.
- It is **impossible to determine the exact location** of an electron. Electrons do not have a definite path around the nucleus. The **probable location of an electron** is based on how much energy it has.
- The modern term “**atomic orbital**” refers to the **physical region or space where the electron can be calculated to be present**.
- Electrons whirl about the nucleus billions of times in one second and can **jump between orbitals in a particle-like fashion**, losing or gaining energy.

The 1927 Solvay Congress on Electrons and Photons

Einstein:
"God does not play dice"

Bohr:
"Einstein, stop telling God what to do"

In October 1927, the world's most notable physicists met to discuss the newly formulated quantum theory and subatomic makeup. **17 of the 29 attendees were or later became Nobel Prize winners.**

Atomic Structure Summary

- All atoms have:
 - a positively charged **nucleus**
 - and negatively charged **electrons** moving around within atomic orbitals
- Atomic **nucleus** consists of:
 - positively charged **protons**
 - and **neutrons** that have no electric charge
- Atoms are neutral:
of protons = # of electrons

Understanding Elements

The number of protons and neutrons in the nucleus give the atoms their specific characteristics.

- All atoms of the same chemical element contain the same **number of protons**, defined by a unique **atomic number** of that element.
- For example, all helium atoms, and only helium atoms, contain two protons and have an atomic number of 2.
- Atoms are also characterized by:
 - **atomic mass**, "relative isotopic mass" in *unified atomic mass units*, which is roughly (within 1%) equal to the whole mass number (since the mass of a proton and the mass of a neutron are almost the same and the mass of the atom's electrons is negligibly small)
 - **mass number**, which is a **sum of the number of protons and the number of neutrons in the nucleus** (number of *nucleons*)

Periodic Table of Elements

is arranged in order of increasing atomic number

(shown *color-coded* according to discovery timeline from antiquity to 2012)

1 H																	2 He
3 Li	4 Be											5 B	6 C	7 N	8 O	9 F	10 Ne
11 Na	12 Mg											13 Al	14 Si	15 P	16 S	17 Cl	18 Ar
19 K	20 Ca	21 Sc	22 Ti	23 V	24 Cr	25 Mn	26 Fe	27 Co	28 Ni	29 Cu	30 Zn	31 Ga	32 Ge	33 As	34 Se	35 Br	36 Kr

- Known in antiquity
- also known when (akw) Levoisier published his list of elements (1789)
- akw Mendeleev published his periodic table (1869)
- akw Deming published his periodic table (1923)
- akw Seaborg published his periodic table (1945)
- also known (ak) up to 2000
- ak to 2012
